

# **A VALIDITY AND RELIABILITY STUDY OF THE "ASSESSMENT OF FAMILY VIEWS IN LEISURE ACTIVITIES INVENTORY"**

Kerem Yıldırım ŐİMŐEK, Fatma YAĐCI  
Anadolu University

The purpose of this study is to test the reliability and validity of the "Assessment of family views in leisure activities Inventory" which is developed by ŐimŐek (2005). Population of the study is family members of the children participating in leisure time activities (guitar, English, chess, volleyball, table tennis, taekwondo, basketball and track and field) which are performed within the scope of the Eskisehir TepebaŐı Municipality Town Houses Project. A total of 501 family members were included to the study who are selected by simple random sampling method. Content validity, convergent validity, construct validity, and external validity tests are made for the "Assessment of family views in leisure activities Inventory". Then, to determine time invariance property of the scale the test-re test technique, to determine the reliability, Cronbach's Alpha, which is related to the coefficient of internal consistency and item-total correlation analysis were conducted. The scale undertaken as part of our research is discussed in terms of reliability and validity.
